

Abstract

A display/indication and indication method for issuing danger warnings, in particular in a motor vehicle, with determination of an urgency level of the danger warning to be issued. One of a plurality of predefined display/indication modes is selected as a function of the determined urgency level and the danger warning is indicated with the selected display/indication mode. At least one of the display/indication modes includes a voice output and at least one further display/indication type which warns about the danger, with only the preferably single voice output containing information about the determined urgency level.
